# Problem

## Background

You work for the *New Horizons* mission. Few months ago the probe flew near *Pluto*, but it is still in the *Kuiper belt* and the mission is not yet concluded.

The astrophysicists want you to build a program for calculating when the probe will reach the end of the belt, or more in general when it will reach a certain distance from the sun.

## New Horizons Full Trajectory - Overhead View

Distance from Sun (AU): 33.46    Heliocentric Velocity (km/s): 14.49

## Astronomical Units (AU)

1 AU is approximately the average distance from the Sun to Earth, and the exact value is:

$$\begin{aligned} 1 \text{ AU} &= 149597870700 \text{ m} \\ &= 149597870,700 \text{ km} \end{aligned}$$

Distance from Earth (AU): 33.16

Distance from Pluto (AU): 0.53

Round-Trip Light Time (hh:mm:ss): 09:11:38

# Model

## Input

- ✓ Current **distance** from the Sun (in AU)
- ✓ Current **velocity** respect the Sun in radial direction (in km/sec)
- ✓ **Target** distance from the Sun (in AU)

## Output

- ✓ The necessary **time** from now to reach the target (in sec)

## Approximations

- ✓ New Horizons probe is not going in radial direction respect the sun, but for now we can assume a radial direction and ignore the error
  - An improvement to the program can be the possibility to specify the angular deviation from the radial direction

## Physics

After the acceleration phases

([https://en.wikipedia.org/wiki/Gravity\\_assist](https://en.wikipedia.org/wiki/Gravity_assist)), probes are moving in **uniform linear motion**, the law that govern it is:

$$\Delta x = v \cdot \Delta t$$

where  $\Delta x$  is the distance covered in  $\Delta t$  time by a body that is moving at a constant velocity  $v$  in a linear direction.

So if you know the position  $x_p$  and the velocity  $v_p$  of the probe, and the position  $x_t$  of the target in the radial rectilinear direction you can calculate:

$$\begin{aligned}\Delta x &= x_t - x_p \\ \Delta t &= \frac{\Delta x}{v_p} = \frac{x_t - x_p}{v_p}\end{aligned}$$

## Unit of measures

For doing the calculations you need coherent unit of measures, so if  $x_p$  and  $x_t$  are expressed in  $AU$  and  $v_p$  is in  $km/s$ , first is necessary to convert  $x_p$  and  $x_t$  in  $km$  using:

$$\begin{aligned} 1 \text{ AU} &= 149\,597\,870\,700 \text{ m} \\ &= 149\,597\,870,700 \text{ km} \end{aligned}$$

# Algorithm
